ARTIFICIAL INTELLIGENCE TEMPERATURE CONTROLLER

User Manual

AI-5097

Version 7.6

(Panel design may be slightly different to real products)
I. Model Code Symbol

The type of AI-5097 is made up of 5 parts:

<table>
<thead>
<tr>
<th>AI-5097</th>
<th>A</th>
<th>G</th>
<th>L2</th>
<th>L2</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
</tr>
</tbody>
</table>

1. Basal function of instrument

AI-5097 Economical Intelligent Temperature Controller 0.3%FS ± 0.1°C (0.0 Decimal)

2. Front panel dimension

<table>
<thead>
<tr>
<th>Size</th>
<th>Front Panel width × height</th>
<th>Cut Out width × height</th>
<th>Depth Behind Mounting Surface</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>96 × 96mm</td>
<td>92 × 92mm</td>
<td>100mm</td>
</tr>
<tr>
<td>D</td>
<td>72 × 72mm</td>

<td>SSR voltage output module (30mA/12VDC)</td>
</tr>
<tr>
<td>G5</td>
<td>Dual SSR voltage output module (30mA/12VDC)</td>
</tr>
<tr>
<td>W1</td>
<td>TRIAC no contact normal open discrete output module, suitable for AC contactors up to 80A, and has low interference and long life.</td>
</tr>
<tr>
<td>W2</td>
<td>TRIAC no contact normal close discrete output module, suitable for AC contactors up to 80A, and has low interference and long life.</td>
</tr>
<tr>
<td>K1</td>
<td>TRIAC zero crossing trigger output module. One loop output, suitable for single-phase power.</td>
</tr>
<tr>
<td>K3</td>
<td>Three phases TRIAC zero crossing trigger output module (For 100~380VAC), will plug in <strong>OUPT</strong> slot and <strong>MIO</strong> slot at same time.</td>
</tr>
</tbody>
</table>

**Note1:** For instrument of dimension D2, because of the volume limit, when L1 or L5 module is installed in ALM, L1 can't be installed in OUPT, but L2, which is smaller and able to be installed instead.

**Note2:** K3 can't be installed in instrument with dimension D or D2. There isn't AUX slot in D2 instruments. L5 module can't be installed in ALM slot of instrument with dimension D.

DISPLAY AND OPERATIONS

① Upper display window, displays PV, parameter code, etc.
② Lower display window, displays SV, parameter value, or alarm
③ Setup key, for accessing parameter table and conforming parameter modification.
④ Data shift key, and auto tuning.
⑤ Data decrease key (Run/Hold)
⑥ Data increase key (Stop)
⑦ 10 LED indicating lamps.
MAN and COM lamps is non-applicable.
RUN shows the control status.
MIO, OP1, OP2, AL1, AL2, AU1 and AU2 indicate I/O operation of the corresponding module.

Basic display status:
When power on, the upper display window of the instrument shows the process value (PV), and the lower window shows the set-point (SV). This status is called basic display status.
When the input signal is out of the measurable range (for example, the thermocouple or RTD circuit is break, or input specification sets wrong), the upper display window will alternately display “orAL” and the high limit or the low limit of PV, and the instrument will automatically stop output. If the lower display window alternately display “HIAL”, “LoAL”, “HdAL” or “LdAL”, it means high limit alarm, low limit alarm, deviation high alarm, and deviation low alarm happening.
OPERATION DESCRIPTION

- **Set Value Setting:**
  In basal display status, if the parameter lock “Loc” isn’t locked, we can set setpoint (SV) by pressing `<`, `>`, or `▲`. Press `▼` key to decrease the value, `▲` key to increase the value, and `<` key to move to the digit expected to modify. Keep pressing `▼` or `▲`, the speed of decreasing or increasing value get quick. The range of setpoint is between the parameter SPL and SPH. The default range is 0~400.

- **Parameter Setting:**
  In basal display status, press `▲` and hold for about 2 seconds can access Field Parameter Table. Pressing `▲` can go to the next parameter; pressing `<`, `>`, or `▲` can modify a parameter. Press and hold `<` can return to the preceding parameter. Press `▲` (don't release) and then press `<` simulating can escape from the parameter table. The instrument will escape automatically from the parameter table if no key is pressed within 30 seconds. Setting Loc=808 and then press `<` can access System Parameter Table.

- **AI artificial intelligence control and auto tuning**
  When AI artificial intelligence control method is chosen (CtrL=APld), the PID parameters can be obtained by running auto-tuning. In basal display status, press `<` for 2 seconds, the “At” parameter will appear. Press `▲` to change the value of At from “off” to “on”, then press `<` to active the auto-tuning process. During auto tuning, the instrument executes on-off control. After 2-3 times of on-off action, the instrument will obtain the optimal control parameter value. If you want to escape from auto tuning status, press and hold the `<` key for about 2 seconds until the “At” parameter appear again. Change “At” from “on” to “off”, press `<` to confirm, then the auto tuning process will be cancelled.

**Note 1:** If the setpoint is different, the parameters obtained from auto-tuning are possible different. So you’d better set setpoint to an often-used value or middle value first, and then start auto-tuning. For the ovens with good heat preservation, the setpoint can be set at the highest applicable temperature. Depending on the system, the auto-tuning time can be from several seconds to several hours.

**Note 2:** Parameter Ctl (on-off differential, control hysteresis) has influence on the accuracy of auto-tuning. Generally, the smaller the value of Ctl, the higher the precision of auto tuning. But Ctl parameter value should be large enough to prevent the instrument from error action around setpoint due to the oscillation of input. Ctl is recommended to be 2.0.

**Note 3:** The instrument has the function of self-learning. It is able to learn the process while working. The control effect at the first run after auto tuning is probably not perfect, but excellent control result will be obtained after a period of time because of self-learning.
## III. PARAMETER AND SETTING

### Field parameter table (Primary parameters)

<table>

</tbody>
</table>
| **PASd** | **Password** | When PASd=0～255 or AF.D=0, set Loc=808 can enter the whole parameter table.
When PASd=256～9999 and AF.D=1, only Loc=PASd can access the whole parameter table.

**Please set PASd cautiously, if the password is lost, you can't access the parameter table again.** |

<tr>
<td><strong>EP1～EP8</strong></td>
<td>Field parameter definition</td>
<td>Define 0～8 of the parameters as field parameters. If the number of the field parameters is less than 8, the first idle EP parameter should be set to &quot;nonE&quot;. The initial values of EPs and Loc are EP1=HIAL, EP2=LoAL, EP3=HdAL, EP4=LdAL, EP5=nonE, EP6=nonE, EP7=nonE, EP8=nonE, nonE and all parameter codes</td>
</tr>
</tbody>
</table>
EP8=nonE and Loc=0.
You can redefine field parameters and Loc to change operation style. For example, you can execute auto tuning from field parameter instead of by pressing ☻ in basic display status, and only take HIAL and HdAL as field parameter.
The EP parameters and Loc should be set as follows:
EP1=HIAL, EP2=HdAL, EP3=At, EP4=nonE, Loc=1
Additional Remarks of Special Functions

3.3.1 Single-phase phase-shift trigger output
When OPt is set to PHA, installing a K5 or K6 module in OUTP slot can single-phase phase-shift trigger a TRIAC or 2 inverse parallel SCRs. It can continuously adjust heating power by control the conduction angle of thyristor. With non-linear power adjustment according to the characters of sine wave, it can get ideal control. The trigger adopts self-synchronizing technology, so it can also work even when the power supplies of the instrument and the heater are different. Phase-shift trigger has high interference to the electric power, so user should pay attention to the anti-interference ability of other machines in the system. Now the K5 or K6 module can be only used in 50Hz power supply.

3.3.2 Alarm blocking at the beginning of power on
Sometimes the fault alarm may occur at the beginning of power on. In a heating system, at the beginning of power on, its temperature is much lower than the set point. If low limit and deviation low limit are set and the alarm conditions are satisfied, the instrument should alarm, but there is no problem in the system. Contrarily, in an refrigerating system, the unnecessary high limit or deviation high limit alarm may occur at the beginning of power on. Therefore, AI instruments offer the function of alarm blocking at the beginning of power on. When Act is set to rEbA or drbA, the corresponding low or high alarms are blocked until the alarm condition first clears. If the alarm condition is satisfied again, the alarm will work.

3.3.3 Setpoints switch
If an I2 module is installed in MIO slot (or bAud=1 and I2 installed in COMM slot). User can connect external on off switch to realize some control function. Set Et = rest, can switching program run and stop. For AI-518, or AI518P when its Pno=0, set Et = SP1.2, can switching between setpoint 1 and setpoint 2.
### IV. Symbol Description

<table>

</thead>
</table>
| orAL   | Input specification setting is incorrect  
Or Input wiring is disconnected  
Or Short circuited |
| HIAL   | High limit alarm  
LoAL   | Low limit alarm  
HdAL   | Deviation high alarm  
dLAL   | Negative deviation alarm  
EErr   | IC Software error  
8888   | IC Software error |
V. INSTRUMENT INSTALLATION AND WIRING

Wiring graph for instruments with dimension A, B or F

Note: The compensation wires for different kinds of thermocouple are different, and should be directly connect to the terminals. Connecting the common wire between the compensation wire and the terminals will cause measurement error.

Wiring graph for D dimension (72mmX72mm) instruments

Note: The graph suits for upright instruments with dimension A or E. For instruments with dimension F, just clockwise rotate the graph 90 degree.
Wiring graph for D2 dimension (48X48mm) instruments:

For 0-5V, 1-5V and 0-10VDC input, please request during order to have external precise resistor equipped. The input terminal are 8,9. Choose correct INP parameter as 0-500mV or 100-500mV.

For 0-20mA or 4-20mA input, please request during order to have external 25ohm resistor equipped. The input terminal are 8,9. Choose correct INP parameter as 0-500mV or 100-500mV.
